1 The following data show the caries experience of children in 21 communities according to the (natural) fluoride concentration of their public water supply. DMF denotes "Decayed, Missing or Filled".

| Community | DMF Teeth per 100 children | Fluoride Concentration in ppm |
| :---: | :---: | :---: |
| 1 | 236 | 1.9 |
| 2 | 246 | 2.6 |
| 3 | 252 | 1.8 |
| 4 | 258 | 1.2 |
| 5 | 281 | 1.2 |
| 6 | 303 | 1.2 |
| 7 | 323 | 1.3 |
| 8 | 343 | 0.9 |
| 9 | 412 | 0.6 |
| 10 | 444 | 0.5 |
| 11 | 556 | 0.4 |
| 12 | 652 | 0.3 |
| 13 | 673 | 0.0 |
| 14 | 703 | 0.2 |
| 15 | 706 | 0.1 |
| 16 | 722 | 0.0 |
| 17 | 733 | 0.2 |
| 18 | 772 | 0.1 |
| 19 | 810 | 0.0 |
| 20 | 823 | 0.1 |
| 21 | 1037 | 0.1 |

- Fit the relation E[DMF Teeth] $=\beta_{0}+\beta_{1} \log [F l u o r i d e+0.1]$
- Use the "pure error", estimable from the "repetitions at same fluoride level", to test the goodness of fit of this model.
the data are under "caries data" in www.epi.mcgill.ca/hanley/c697/

2 Is caffeine "cleared" faster from smokers than non-smokers?
Data and documentation are in http://www.epi.mcgill.ca/hanley/c622/
For each of your six subjects ..

- Obtain the estimated slope $\mathrm{b}_{1}$ and its associated SE
\{ model: $\mathrm{E}\left[\log [\right.$ caffeine] $]=\beta_{0}+\beta_{1}$ (Time elapsed) \}
- Rank the $6 b_{1}$ 's according to their precision (SE)
- Say why you think the estimates rank in this order
(base your explanation on visual inspection of 6 plots of $\log [c a f f e i n e] ~ v s . T i m e ~) ~$

3 Using Simple Linear Regression for Prediction: How Faithful was Old Fathful? (Question 3 of homework due Friday June 9, 2000 in Course 678 this past june)

4 Using Non-linear relationships - vocabulary data for 1 child
(Question 6 of homework due Friday June 9, 2000 in Course 678 this past june)
