**Survival (white lower band) and cumulative mortality from prostate cancer (darker upper band) and other causes (gray middle band) up to 15 years after diagnosis stratified by Gleason score (row).**

Cause-specific survival curve (black line] over-estimates cancer mortality.

Cause-Specific Survival Curves "censor" patients who die of other causes ... In effect, this method "resurrects" these men and subjects them AGAIN to the risk of a prostate cancer death from the time of "censoring" onwards. So, Cause-Specific survival curves over-estimate cancer mortality.
